Plant Protect Concentrate eA300

100% Bio-Based Adjuvent

For use on fruits, vegetables, plants, flowers, trees, grass or shrubs.
This product is harmless to humans, pets and the environment.

Disclaimer: These are independent results from Mexico, the source of which cannot be disclosed. BioWash is the product that we have re-named Plant Protect or eA300

Blackberry and lemon crops ripen as much as one month earlier.

In La Ruana, a farmer gets 40% more money for the kilo of lemons grown only with BioWash, using no toxic insecticides.

Near the farmer's ranch, there is a 14-hectare Persian lemon orchard that was dying of the yellow disease. The lemon orchard owner had spent a fortune during the past year on toxic chemicals to no avail. He was ready to tear out the trees and burn them.

The farmer convinced the lemon producer to try the product. BioWash sanitized these virus-infected trees. After only 45 days his orchard is a vibrant green, both fruit and trees. Only a few yellowish trees remain. People come from all over to see this orchard, in disbelief. The agricultural engineers are amazed. Such a cure has never been seen before.

In Ario de Rosales, Michoacan, blackberries are a major crop. When the first berries appear, one the biggest matures first but a leafy sprout comes out of the end of the berry. They call this "escobilla." These berries have no commercial value. BioWash eliminated this problem. This astonished local farmers who have grown accustomed to discarding such berries. The berries are bigger, sweeter and last longer on the vine, thus increasing their value. They have greater consistency and more shine, as compared to non-BioWashed berries that must be harvested immediately when ripe lest they get soft and spoil. All viruses, fungi and molds have been eliminated. In addition not a single insect is present. Ironically I found a weed in between rows that had a few white flies around it but they would not approach the BioWash treated bushes. The farmer said he had forgotten to spray the weed!

In Colima state, sugar cane growers have controlled all diseases afflicting their precious crops. There are over half a million hectares of sugar cane in Mexico

In La Huacana BioWash has eliminated all pests from the hibiscus flowers and Jamaica crop, a very important part of the small farm economy here.

The BioWash has eliminated garrapata the tiny insect that attaches itself to cattle ears or underbelly causing debilitation sickness, loss milk production, etc. It has also eliminated the insects that plague chickens and controlled odors.

In lab tests, the Degreaser makes the removal of salt from oil an easier, faster and cheaper process. This has great implications because nearly all Mexican, Venezuelan and Latin American oil is very high in salt content, making the refining process more costly.

A doctor is growing beautiful papayas, sweet, juicy oranges and pomegranates in a cold climate in the state of Guanajuato, defying traditional climate zones.

These are some of the exciting findings that have been reported to us from Mexico.
